

HTML Summary

HTML is the basic structure of any website. It is the first step in web development because it is responsible for creating the content and organizing it on the page. It also works by using tags, and every tag has a specific purpose. For example, headings are used to organize titles, paragraphs are used for text, images are used to add pictures, and links are used to move between pages. The most important thing I learned is that the structure of the HTML page is very important. Every page starts with the DOCTYPE, then the html tag, the head section which contains information about

The main benefits of HTML:

- It is easy to learn and understand.
- It is supported by all web browsers.
- It provides the basic structure for every website.
- It helps organize content in a clear way.
- It works with CSS and JavaScript to build complete websites.

Important HTML Concepts:

1. HTML Document Structure:

Every HTML page starts with a basic structure:

```
<!DOCTYPE html>
<html>
<head>
  Page information
</head>
<body>
  Page content
</body>
</html>
```

The <head> contains information about the page like the title and metadata, while the <body> contains everything displayed on the webpage.

2. HTML Tags:

HTML uses tags to create different elements. Most tags have an opening tag and a closing tag.

- <html>: Defines the beginning of an HTML document.
- <head>: Contains information about the webpage that is not directly displayed.
- <title>: Defines the page title shown in the browser tab.
- <body>: Contains all visible content on the webpage.
- <h1> to <h6>: Used for headings. <h1> is the biggest and most important heading.
- <p>: Used to create paragraphs of text.
- <a>: Used to create links to other pages or websites.
- : Creates an unordered list.
- : Creates an ordered list.
- : Defines an item inside a list.

- `<table>`: Used to create tables.
- `<tr>`: Creates a table row.
- `<td>`: Creates a table data cell.
- `<th>`: Creates a table heading cell.
- `<form>`: Used to create forms for collecting user information.
- `<input>`: Creates input fields.
- `<textarea>`: Creates a text area for longer messages.
- `<button>`: Creates buttons.

Semantic HTML Tags:

- `<header>`: Represents the top part of a webpage.
- `<nav>`: Used for navigation links.
- `<main>`: Contains the main content.
- `<section>`: Groups related content.
- `<footer>`: Represents the bottom part of a webpage.

Conclusion:

HTML is the foundation of web development. Learning HTML is the first step for anyone who wants to become a web developer. By understanding HTML tags and structure, developers can create organized webpages and later improve them using CSS and JavaScript.
